Reading conventions

Confirmed	Visible in the supplied screenshots of the Skill Wallet dashboard or the Salesforce Developer Org.
Partly confirmed / Listed	Appears in a screenshot, but some details (API name, data type, values, or build status) are not visible, or it is only listed as a task or draft.
Proposed / Planned	Not visible in the screenshots. Suggested by the project brief or by the author, and it must be confirmed by the team.

Screenshot evidence is described in Appendix A. In every table the same colours are used for the status of an item.

2. Project Overview

The **Student Enrollment & Course Management System** is a Salesforce-based group project developed in a Salesforce Developer Edition org and tracked on the Skill Wallet project dashboard. The team is led by SAIF ALI, with T MOHAMMED RAZI and S MOHAMMED ZABIULLAH as team members. This document belongs to **Phase 1: Requirement Analysis & Planning** and covers planning only.

2.1 Purpose of the Project

The project aims to streamline and automate student enrollment, course management, instructor assignment, approval processes, payments and reporting inside Salesforce. Instead of keeping this information in separate registers or spreadsheets, all records are stored in one connected system where every record can be found, checked and reported on.

2.2 Problems the System Solves

- **Scattered records:** student, course and instructor details are kept in one place.
- **Wrong or incomplete data:** validation rules stop invalid entries, for example a non-college email address.
- **Manual instructor allocation:** the instructor can be chosen from the course category instead of by hand.
- **Unclear approval status:** each enrollment can carry a status that shows whether it is waiting, approved or rejected.
- **Slow reporting:** reports such as students by status can be produced directly from stored records.

2.3 How Salesforce Helps

Salesforce is a cloud platform that stores data in **objects** (similar to database tables), describes each item with **fields** (similar to columns) and connects objects through **relationships**. Its declarative tools, such as validation rules, flows and approval processes, let an administrator build business logic without writing code. Reports and dashboards then present the stored data. These features match the needs of an enrollment system, which is why Salesforce was chosen as the platform.

3. Problem Statement

When enrollment work is done manually, the same information is written many times, and mistakes are difficult to notice. The main challenges are listed below.

Area	Challenge in a manual process
Students	Student details (name, contact, address, status) are stored in different files, so records become duplicated or out of date.
Courses	Course name, category, duration and fees are not kept in a single reliable list, and changes are not shared with everyone.
Enrollments	It is hard to know which student joined which course, and the same student may be entered twice.
Instructors	Instructors are allocated by hand. There is no consistent rule linking a course category to a suitable instructor.
Approvals	Approval depends on messages or paper forms, so requests can be delayed, lost, or approved without checking conditions such as fee payment.
Payments	Fee status is tracked separately from the enrollment, so unpaid students may be approved by mistake.
Reports	Reports must be prepared manually, which takes time and can contain errors.

Problem to be solved: the college needs one controlled system in which students, courses, instructors, enrollments, approvals and payments are recorded consistently, checked by rules, and reported automatically.

4. Business Use Case

Four kinds of users interact with the system. The roles below follow the project brief. The screenshots do not show Salesforce profiles or permission sets, so the exact user setup needs confirmation.

Actor	Role	Interaction with the system
Administrator	Configures and controls the system	Creates objects, fields, rules and automation; manages users; approves enrollments when required; views dashboards.
Enrollment Officer	Handles enrollment work	Creates and updates Student records, enrolls students in courses, checks fee status, and reviews or approves enrollment requests.
Instructor	Teaches the course	Is assigned to courses by category and can view the courses and enrolled students linked to him or her.
Student	Requests a course	Provides personal details, requests enrollment in a course, and receives the approval result.

Main use cases

ID	Use case	Main actor	Summary
UC-01	Register a student	Enrollment Officer	A Student record is created with a college email address.
UC-02	Create a course	Administrator	A Course record is created with category, duration and fees.
UC-03	Enroll a student	Enrollment Officer	An Enrollment record links one Student with one Course.
UC-04	Assign an instructor	Administrator	An Instructor is linked to a course according to its category.
UC-05	Approve an enrollment	Administrator / Enrollment Officer	A pending enrollment is approved or rejected after the fee check.
UC-06	View reports	Administrator	Reports such as Students by Status are opened from stored data.

5. Functional Requirements

Each requirement below is marked as **Confirmed**, **Partly confirmed** or **Proposed** according to the screenshots (see Figure 1 and Appendix A). The Skill Wallet board lists the working tasks of the project; it does not show any task in the Completed column.

5.1 Main Requirements

ID	Requirement	Description	Status and evidence
FR-01	Student management	Store student details: name, email, phone, date of birth, address and status.	Confirmed. The Student object shows these fields in Object Manager.
FR-02	Course management	Store course name, description, category, duration and fees.	Partly confirmed. These Course fields appear in Flow Builder field lists; the Course object page is visible.
FR-03	Student enrollment	Record which student is enrolled in which course.	Partly confirmed. An Enrollment object appears as a tab and as a flow object; its fields are not visible. The dashboard lists lookups from Enrollment to Student and Course.
FR-04	Instructor assignment	Link an instructor to a course, using the course category.	Partly confirmed. The Instructor object is visible. A draft flow with a Check Category decision exists but is Inactive.
FR-05	Enrollment approval	Approve or reject an enrollment only after required checks.	Proposed. Only the dashboard rule name "Fees Must Be Paid Before Approval" points to approval; no approval process is visible.
FR-06	Payment management	Record course fees and whether fees are paid.	Proposed. The Course Fees field is visible; a payment field on Enrollment is not visible.
FR-07	Data validation	Reject invalid data at the time of entry.	Confirmed for the student email rule (active). The fee rule is only listed on the dashboard.
FR-08	Reports and dashboards	Show summary reports and dashboards.	Partly confirmed. A "Students by Status" report is open in the report builder (no records in preview). No dashboard is visible.

5.2 Additional Proposed Requirements

ID	Requirement	Description	Status
FR-09	Prevent duplicate enrollment	The same student should not be enrolled twice in the same course.	Proposed
FR-10	Role-based access	Users should see and edit only the data needed for their role.	Proposed
FR-11	Result notification	The student should be informed when an enrollment is approved or rejected.	Proposed

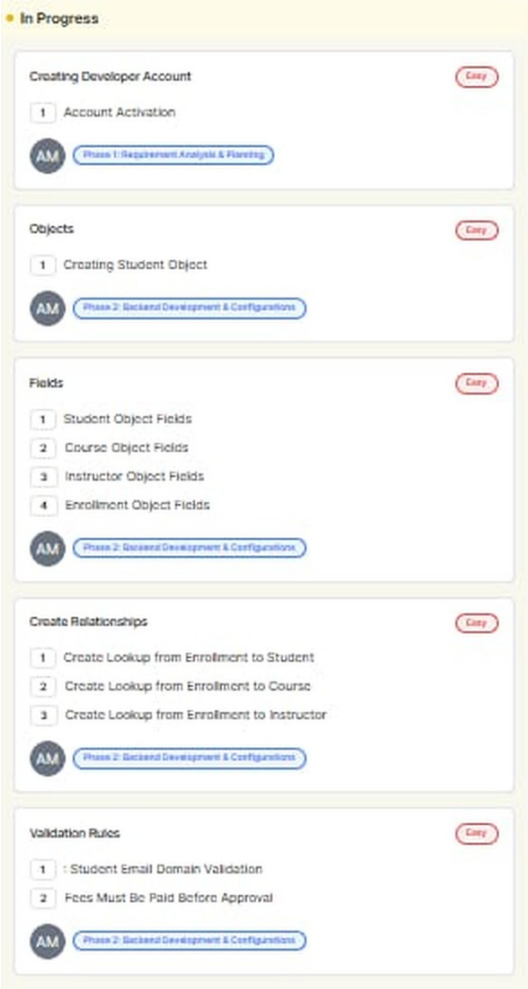

Figure 1: Skill Wallet Kanban board, "In Progress" column, showing the five task cards of the project (dashboard screenshot, 28-09-2026).

6. Salesforce Developer Account Creation

A Salesforce Developer Edition org is a free environment for building and testing applications. It is not a production system, so it is suitable for a college project. The steps below describe the creation process. No screenshot of the sign-up form was supplied, so steps 1 to 4 follow the standard public procedure and should be checked against the team's own experience. Steps 5 and 6 are supported by screenshots.

Step	Action	Evidence / status
1	Visit https://developer.salesforce.com/signup. On 30 September 2026 this address redirected to the Salesforce "Developer Edition" page [1].	Proposed. No screenshot; address checked online.
2	Open the sign-up form on that page.	Proposed. No screenshot.
3	Enter the required registration details (name, email address, role, company or college, country and a unique username in email format).	Proposed. Personal details are not recorded in this document.
4	Verify the email address: open the verification email sent by Salesforce and follow the link when asked.	Proposed. No screenshot.
5	Log in to the Salesforce Developer Org and open Setup.	Confirmed. Figure 2 shows Setup Home after login.
6	Confirm that the environment is ready: the "Developer Edition" label is shown, Object Manager opens, custom objects are deployed, and Flow Builder opens.	Confirmed. These items appear in several screenshots (Appendix A).

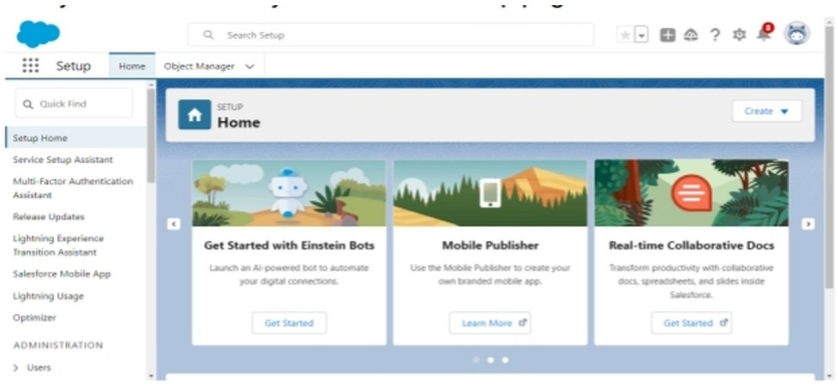

Figure 2: Salesforce Setup Home page after login (screenshot dated 29-09-2026). The Setup menu and Object Manager tab are available.

> **Confidentiality:** passwords, verification codes, security answers and personal login details are deliberately not included in this document. The Skill Wallet card for this task is titled "Creating Developer Account" with the sub-task "Account Activation", and it is tagged Phase 1. Its column on the board is "In Progress".

7. Salesforce Objects

7.1 What Is an Object?

An object is a container for one type of record, in the same way that a table holds one type of data in a database. **Standard objects** (such as User) are provided by Salesforce. **Custom objects** are created by the developer for special needs, and their API names end with __c. Each row in an object is a **record**; for example, one Student record represents one student.

7.2 Objects Used in the Project

Object	Type	API name	Purpose	Status
Student	Custom	Not shown on the screenshot (Student__c expected, to confirm)	Holds one record for each student.	Confirmed. Fields and a validation rule are visible.
Course	Custom	Course__c	Holds one record for each course offered.	Confirmed. Object details page is visible.
Instructor	Custom	Instructor__c	Holds one record for each instructor.	Confirmed. Object details page is visible.
Enrollment	Custom (to confirm)	Not visible (Enrollment__c suggested)	Links a student to a course and carries approval and payment status.	Partly confirmed. Seen as a tab and as a flow object; details page not supplied.
User	Standard	User	Used for Owner, Created By and Last Modified By fields.	Confirmed. Visible as lookup fields.

Course and Instructor object settings

Setting	Course	Instructor
Singular / plural label	Course / Course	Instructor / Instructors
Custom object	Yes	Yes
Deployment status	Deployed	Deployed
Enable Reports, Track Activities, Track Field History	All selected	All selected

> **Observation:** the plural label of the Course object is "Course", the same as the singular label. The team may change it to "Courses" for clearer list views (optional).

7.3 Purpose of the Main Records

- **Student record:** the personal and status information of one student (name, email, phone, date of birth, address and status).
- **Course record:** the details of one course (name, description, category, duration and fees). The category is used to choose the instructor.
- **Instructor record:** the person who teaches courses. The screenshots show Instructor records with names such as Instructor A and Instructor B, which the draft assignment flow refers to.
- **Enrollment record:** the link between a student and a course. It is the natural place for approval status and fee status (proposed).

8. Salesforce Fields

8.1 How Fields Store Information

A field is a single piece of information on a record, such as an email address or a date. The **data type** of a field controls what can be stored in it and how it is shown. The types used in this project are explained below.

Data type	Meaning	Example in the project
Text	Short text with a set length	Student Name (80 characters)
Text Area	Longer text	Student Address (255 characters)
Email / Phone / Date	Values checked for the correct format	Email, Phone, Date of birth
Picklist	Choice from a fixed list of values	Student Status, Category
Number / Currency	Numeric value; currency adds a money format	Course Duration, Course Fees
Checkbox	True or false	Fee Paid (proposed)
Lookup	Link to a record of another object	Enrollment to Student

8.2 Field Tables

In the tables below, the API name is real where the status is Confirmed and only a suggestion where the status is Partly confirmed or Proposed. The suffix __*c* marks a custom field. Course data types are read from the field icons in Flow Builder and need confirmation.

Student object

Object	Field label	API name	Data type	Purpose	Rule or business rule	Status
Student	Student Name	Name	Text (80)	Record name of the student	Standard name field; required by Salesforce	Confirmed
Student	Email	Email__c	Email	Contact email	Validation rule (see 8.3): college email required	Confirmed
Student	Phone	Phone__c	Phone	Contact number	None visible	Confirmed
Student	Date of birth	Date_of_birth__c	Date	Date of birth	None visible	Confirmed
Student	Student Address	Student_Address__c	Text Area (255)	Postal address	None visible	Confirmed
Student	Student Status	Student_Status__c	Picklist	Current status of the student; used in the Students by Status report	Picklist values are not visible; to be confirmed	Confirmed
Student	Owner	OwnerId	Lookup (User, Group)	Record owner	Standard field	Confirmed
Student	Created By	CreatedById	Lookup (User)	Who created the record	Standard field	Confirmed
Student	Last Modified By	LastModifiedById	Lookup (User)	Who last changed the record	Standard field	Confirmed

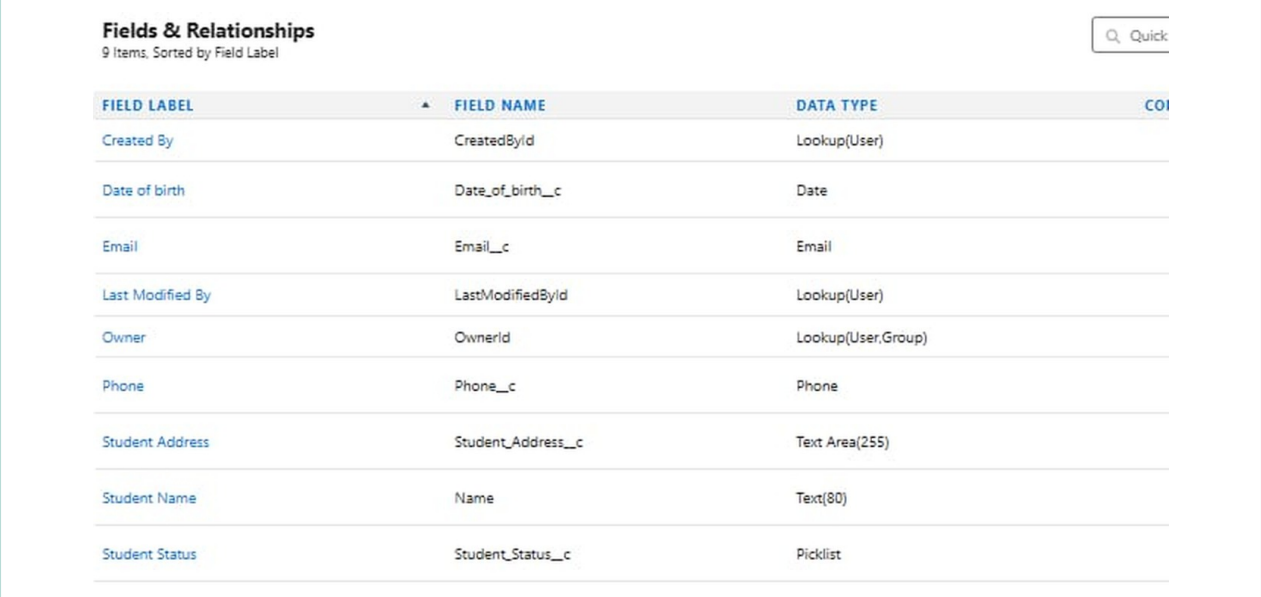

Figure 3: Student object, Fields & Relationships page, showing 9 fields (screenshot dated 28-09-2026).

Course object

Object	Field label	API name	Data type	Purpose	Rule or business rule	Status
Course	Course Name	Name (to confirm)	Text	Name of the course	Standard name field is expected	Partly confirmed
Course	Course Description	Course_Description__c (suggested)	Text	What the course covers	None visible	Partly confirmed
Course	Category	Category__c (suggested)	Picklist	Groups the course; drives instructor assignment	Values to be confirmed (Technology or Technical, Language, Non-Technical)	Partly confirmed
Course	Course Duration	Course_Duration__c (suggested)	Number	Length of the course	Unit (days, weeks or hours) to be confirmed	Partly confirmed
Course	Course Fees	Course_Fees__c (suggested)	Currency	Fee for the course	Used for the fee check before approval	Partly confirmed

Instructor object

No Instructor field is visible in the screenshots, so every field below is a proposal.

Object	Field label	API name	Data type	Purpose	Rule or business rule	Status
Instructor	Instructor Name	Name	Text (80)	Name of the instructor	Standard name field	Proposed
Instructor	Specialization Category	Specialization_Category__c	Picklist	Category the instructor teaches; supports category-based assignment	Same values as Course Category	Proposed
Instructor	Instructor Email	Email__c	Email	Contact email	Format checked by Salesforce	Proposed

Enrollment object

The dashboard lists the three lookups below (Figure 1). Field labels and API names are suggestions. The other fields are proposals needed for approval and payment.

Object	Field label	API name	Data type	Purpose	Rule or business rule	Status
Enrollment	Enrollment Name	Name	Auto Number (or Text)	Identifier of the enrollment	Naming format to be decided	Proposed
Enrollment	Student	Student__c	Lookup (Student)	Which student is enrolling	Should be required	Partly confirmed
Enrollment	Course	Course__c	Lookup (Course)	Which course is chosen	Should be required	Partly confirmed
Enrollment	Instructor	Instructor__c	Lookup (Instructor)	Instructor linked to the enrollment	To be confirmed with the Course to Instructor design	Partly confirmed
Enrollment	Enrollment Status	Enrollment_Status__c	Picklist	Pending, Approved or Rejected	Only approved after fee is paid	Proposed
Enrollment	Fee Paid	Fee_Paid__c	Checkbox	Shows whether fees are paid	Must be selected before approval	Proposed
Enrollment	Enrollment Date	Enrollment_Date__c	Date	Date of the request	None	Proposed

8.3 Validation Rule Visible on the Student Object

The Student object contains one active validation rule. It protects the Email field: when the entered address is not a college address, Salesforce shows an error message next to the field. The allowed email domain is not visible in the screenshot and is therefore not stated here.

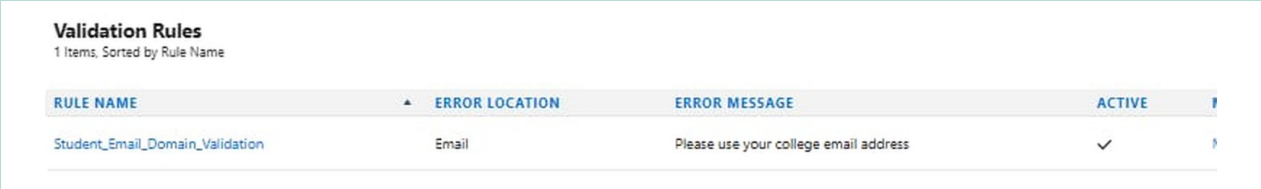

Figure 4: Validation Rules page of the Student object showing Student_Email_Domain_Validation (screenshot dated 28-09-2026).

9. Salesforce Relationships

9.1 Types of Relationships

A relationship connects records of two objects so that data stays consistent. Salesforce offers several types. Definitions follow the Salesforce object reference [2].

Type	Meaning	Effect
Lookup	A one-to-many link from a child record to a parent record.	Does not affect deletion or security. The field is not required unless the developer makes it required.
Master-detail	A stronger link in which the detail record depends on its master.	Detail records follow the master in security and deletion; roll-up summary fields become possible.
Many-to-many	Each record on one side can link to many records on the other side.	Built with a junction object that holds two relationship fields, one to each object.

9.2 Project Relationship Design

ID	Child object	Parent object	Type	Purpose	Status
R1	Enrollment	Student	Lookup	Shows which student is enrolled.	Listed on dashboard (In Progress); not verified in Object Manager
R2	Enrollment	Course	Lookup	Shows which course the student joined.	Listed on dashboard (In Progress); not verified in Object Manager
R3	Enrollment	Instructor	Lookup	Shows the instructor linked to the enrollment.	Listed on dashboard (In Progress); not verified in Object Manager
R4	Course	Instructor	Lookup (suggested)	Stores the instructor chosen by the assignment rule.	Proposed. The Course field list in Flow Builder shows no Instructor field.

None of these relationships can be called implemented from the screenshots alone, because no relationship field is visible on the Enrollment object.

9.3 Junction Object for Students and Courses

One student can enroll in many courses, and one course can have many students. This is a **many-to-many** situation. The Enrollment object solves it: each Enrollment record points to exactly one Student and exactly one Course, so many enrollments can connect the same student to different courses and the same course to different students. Enrollment therefore acts as the junction object, and it also carries the Instructor link.

> **Design decision for the team:** Salesforce describes a junction object as an object with two master-detail fields [2], while the dashboard tasks specify Lookup relationships. Lookups work for this project and are simpler, but they are not required by default and do not delete child records automatically. The team should decide whether the Student and Course lookups will be made required.

9.4 Purpose of Relationships in Data Integrity

- An enrollment can point only to a student and a course that really exist.
- Related lists show all enrollments on a Student or Course page without retyping data.
- Reports can combine data from linked objects, for example students per course.
- Rules can read values from linked records, for example the course fees when checking approval.

9.5 Entity-Relationship Diagram

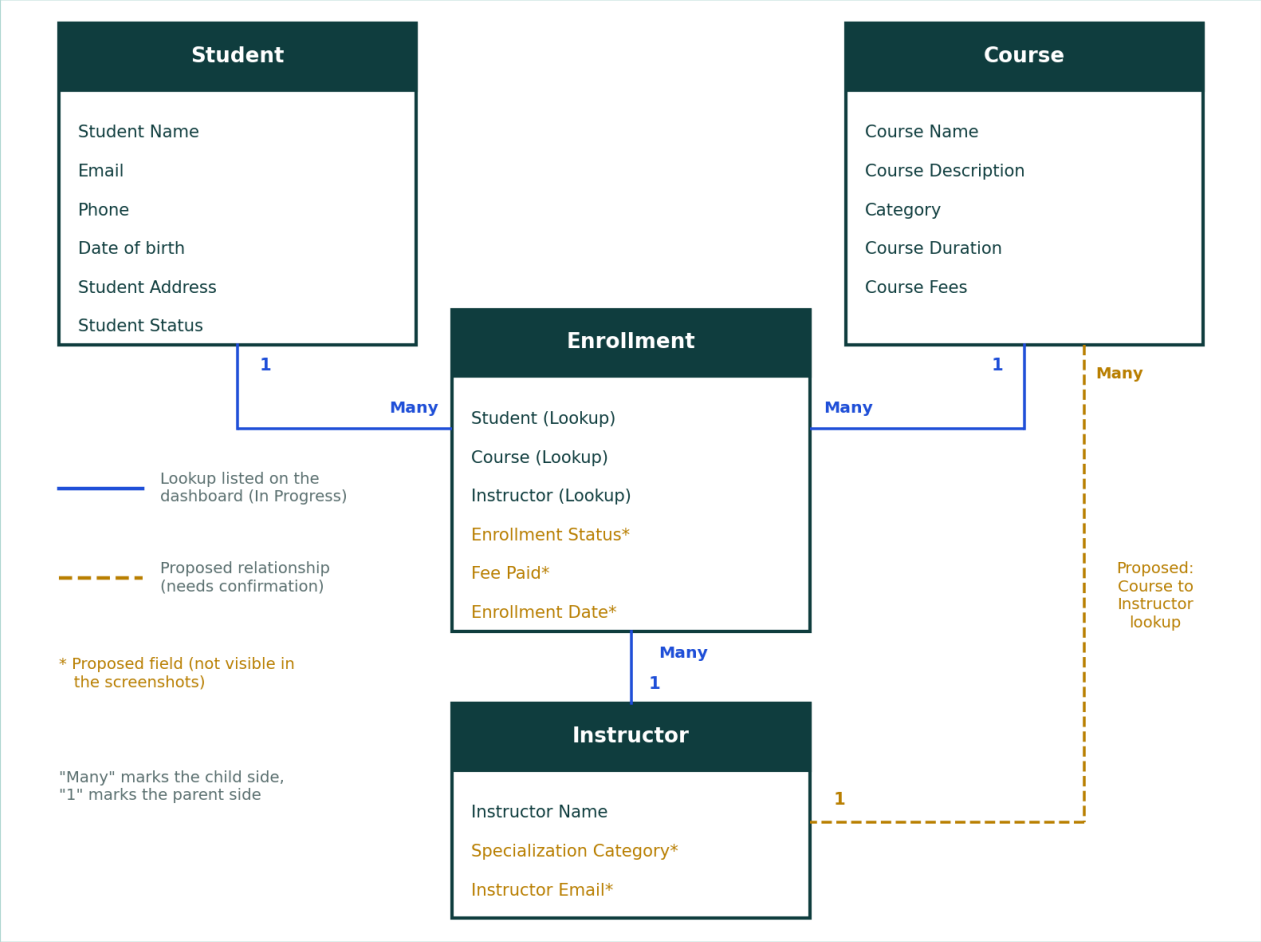

Figure 5: Entity-relationship diagram. Solid lines are relationships listed on the dashboard; the dashed line is a proposed relationship.

10. Business Rules and Process Flow

Business rules are the conditions that the system must enforce. The rules below are grouped by how much the screenshots confirm.

10.1 Documented Project Rules

ID	Rule	Object	Status and evidence
BR-01	A student must use a college email address.	Student	Confirmed. Validation rule Student_Email_Domain_Validation is active; error message: "Please use your college email address".
BR-02	Fees must be paid before an enrollment is approved.	Enrollment (expected)	Listed on dashboard as a validation rule task. No such rule is visible in the screenshots, so it is not confirmed as built.
BR-03	The instructor is assigned according to the course category.	Course	Draft only. A record-triggered flow on Course (AutoAssign_Instructor V1) has a Check Category decision, but it is Inactive and still shows errors.

10.2 Instructor Assignment by Category

The draft flow contains a decision named Check Category. Two screenshots of the draft show different branch labels: one shows a branch named **Technology**, and another shows branches named **Technical** and **Language**. The branch elements refer to Instructor records named Instructor A and Instructor B. The brief also mentions a Non-Technical category, which is not visible in the screenshots.

Course category	Assignment logic	Status
Technical (also labelled "Technology")	Assign the technical instructor (the draft uses the record named Instructor A).	Draft only. The exact category name needs confirmation.
Language	Assign the language instructor (the draft uses the record named Instructor B).	Draft only
Non-Technical	Assign a non-technical instructor.	Proposed. Not visible in the screenshots.
Default outcome	Leave the instructor empty for manual selection.	Needs confirmation. The default branch content is not visible.

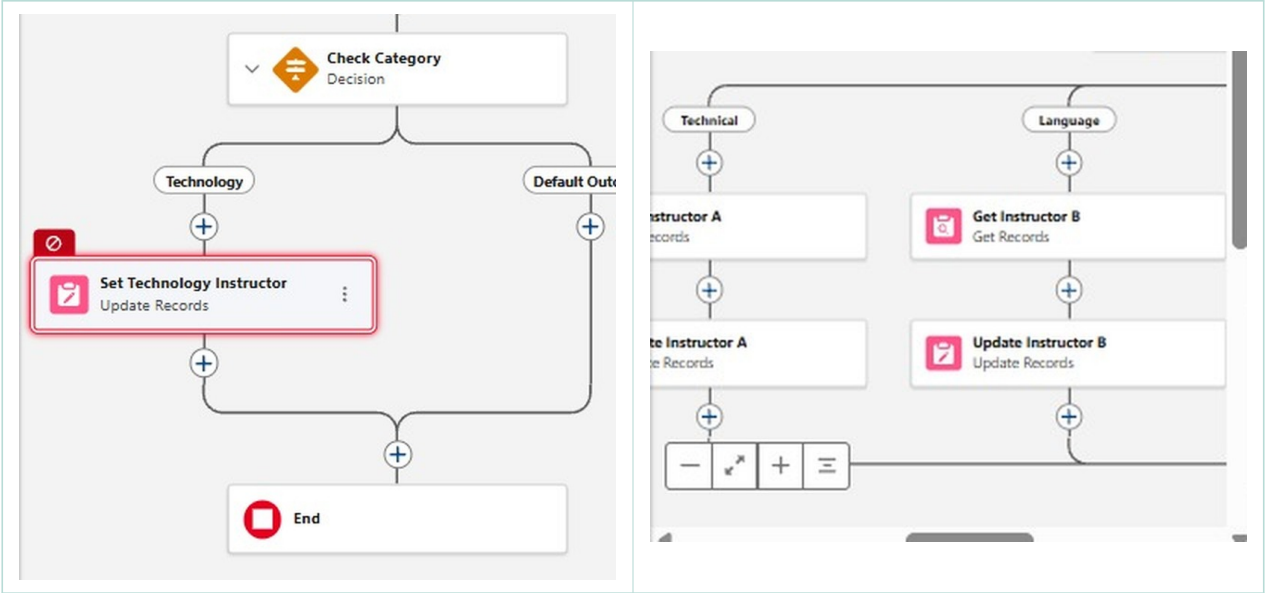

Figure 6: Draft assignment flow in Flow Builder (screenshots dated 29-09-2026). Left: the Technology branch, with an error marker on the Update Records step. Right: the Technical and Language branches.

Important: the flow is Inactive, contains unresolved errors, and belongs to automation work that is outside Phase 1. Instructor auto-assignment must therefore not be described as implemented.

10.3 Proposed Additional Rules

ID	Proposed rule	Reason
BR-04	Every Enrollment must have a Student and a Course.	Prevents incomplete enrollment records.
BR-05	The same Student cannot be enrolled twice in the same Course.	Avoids duplicate enrollments.
BR-06	Enrollment status moves from Pending to Approved or Rejected only.	Keeps the approval history clear.
BR-07	Course Category and Instructor Specialization Category use the same values.	Allows the category rule to work.

10.4 Where the Rules Apply in the Enrollment Process

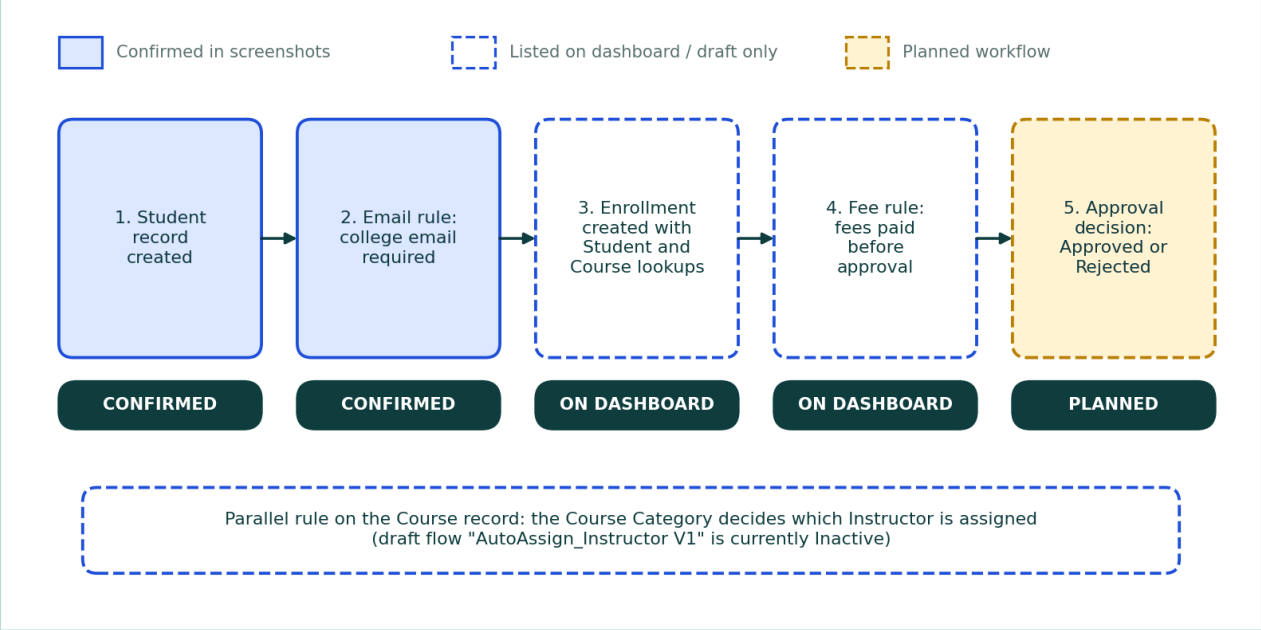

Figure 7: Rule checkpoints along the enrollment and approval process, with the status of each step.

11. Process Flow Diagrams

The diagrams below describe the intended workflows. All of them are **planned workflows**. Only the elements drawn in solid blue, such as the email rule, are supported by screenshots. Colours follow the legend under each diagram.

11.1 Student Enrollment Process

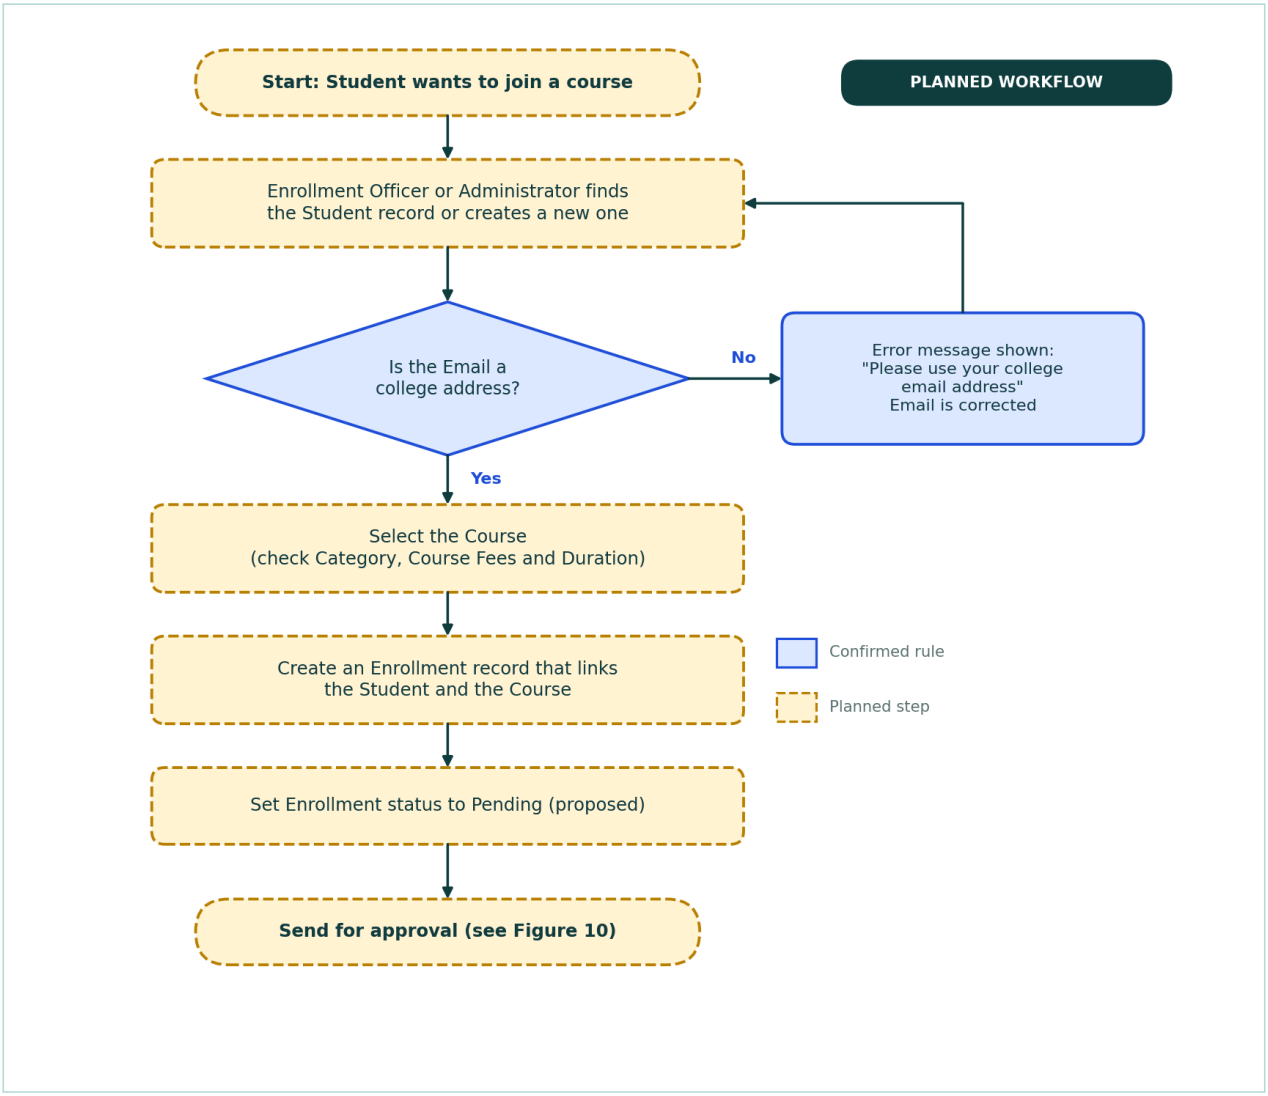

Figure 8: Student enrollment process (planned workflow).

11.2 Course and Instructor Assignment Process

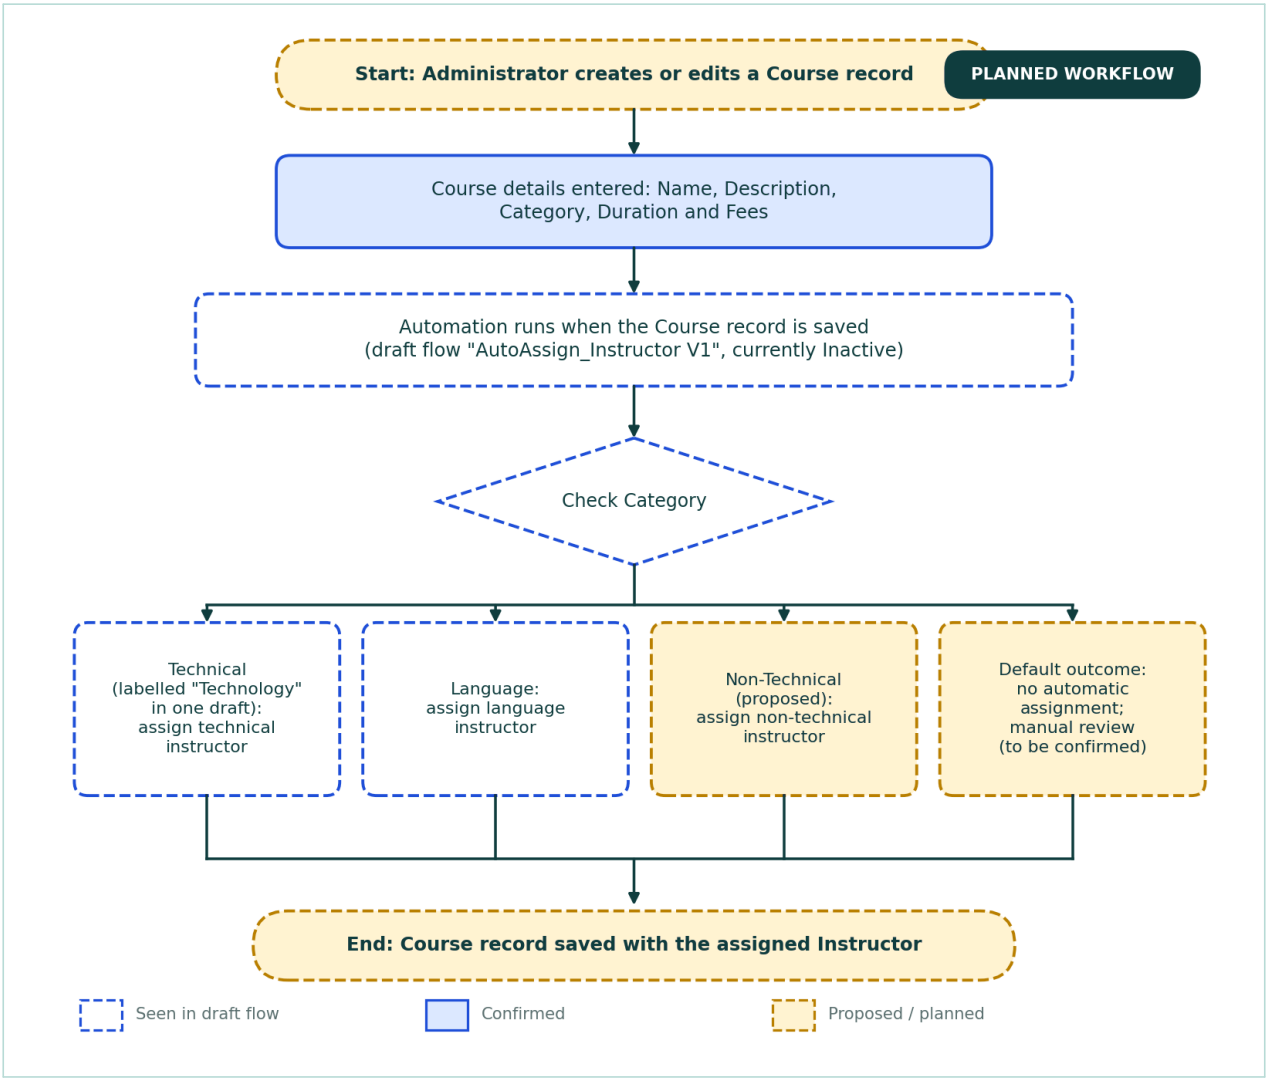

Figure 9: Course and instructor assignment process (planned workflow, based on the inactive draft flow).

11.3 Enrollment Approval Process

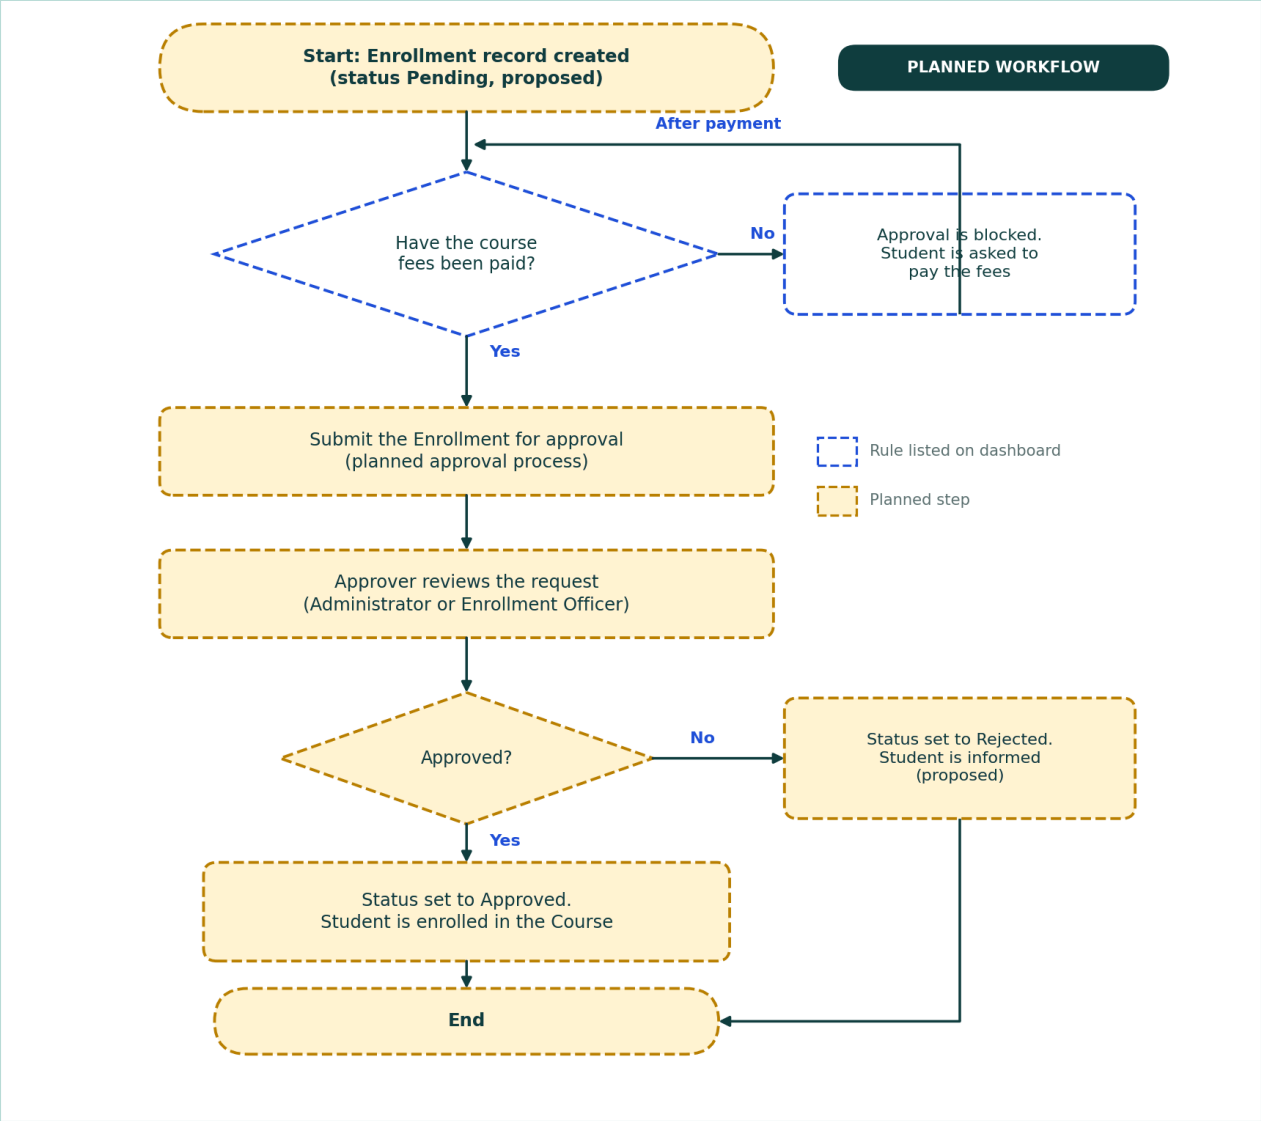

Figure 10: Enrollment approval process (planned workflow).

12. Project Scope, Assumptions, and Constraints

12.1 What Phase 1 Covers

- Analysis of the project requirements and the supplied screenshots.
- Recording the Developer Edition org setup.
- Identifying the objects, fields and relationships that the system needs.
- Defining the business rules for enrollment, payment checks and instructor assignment.
- Preparing process flow diagrams, scope, assumptions and constraints.

12.2 Planned for Later Phases

The building and configuration work is planned for later phases and is not documented here. On the dashboard, the cards for Objects, Fields, Create Relationships and Validation Rules are tagged **Phase 2: Backend Development & Configurations**. Other later work includes flows and approval automation, tabs and the Lightning app, security setup, reports and dashboards, testing, and final documentation.

12.3 Assumptions

- The Developer Edition org is the single development environment for the whole team (how access is shared needs confirmation).
- One student can enroll in many courses, and one course can have many students.
- Course fees are stored on the Course record and are paid in one currency.
- Payments are recorded inside Salesforce (for example, a Fee Paid field); no online payment gateway is connected.
- The category values on Course and Instructor will be fixed before automation is built.

12.4 Constraints

- A Developer Edition org has limited storage and user licences; the exact limits should be checked in the org itself.
- The org is for development and learning, not for real production data.
- The team depends on declarative tools (validation rules, flows, approval processes) and does not plan custom code.
- The academic schedule and the Skill Wallet task structure limit the time available for each task.
- The analysis is limited to the screenshots supplied; anything not visible is marked for confirmation.

12.5 Boundaries of the Current Phase

This document plans and records. It does not claim that any object, field, relationship, validation rule, flow or approval process is finished, except where a screenshot shows it (for example the active email validation rule). The statuses in Section 13 come only from the dashboard.

12.6 Items That Need Confirmation

No.	Item
1	Edition, creation details and access of the Developer Org.
2	API name of the Student object, and full details of the Enrollment object and its fields.
3	API names and data types of the Course fields; all fields of the Instructor object.
4	Category values (Technology or Technical, Language, Non-Technical) and Student Status values.
5	The permitted college email domain, and whether the fee rule exists.
6	Lookup or master-detail choice, and whether Course needs its own Instructor lookup.
7	Task durations, which are not displayed on the dashboard, and the Phase tags of the dashboard cards.

13. Phase 1 Timeline and Deliverables

The dashboard cards show only a difficulty tag ("Easy"), a phase tag and a column. **No duration is displayed.** The durations below are therefore proposed estimates, marked as such, and no completion dates are given.

Task	Description	Estimated duration	Expected deliverable	Status
1. Creating a Salesforce Developer Account	Sign up, verify the email, log in and confirm the org.	Not shown. Proposed: 0.5 day	Working Developer Org; Section 6	Card "Creating Developer Account" (Phase 1) is In Progress. Org access is visible.
2. Identifying Salesforce Objects	Decide which objects the system needs.	Not shown. Proposed: 1 day	Object list; Section 7	Documented here. Dashboard card "Objects" is tagged Phase 2 and In Progress.
3. Defining Fields	List fields, types and rules for each object.	Not shown. Proposed: 1 day	Field tables; Section 8	Documented here. Dashboard card "Fields" is tagged Phase 2 and In Progress.

Task	Description	Estimated duration	Expected deliverable	Status
4. Creating Relationships	Design lookups and the junction approach.	Not shown. Proposed: 0.5 day	Relationship table and ERD; Section 9	Documented here. Dashboard card "Create Relationships" is tagged Phase 2 and In Progress.
5. Defining Business Rules	Write the enrollment, fee and assignment rules.	Not shown. Proposed: 1 day	Rule tables; Section 10	Documented here. Dashboard card "Validation Rules" is tagged Phase 2 and In Progress.
6. Preparing Process Flow Diagrams	Draw the three planned workflows.	Not shown. Proposed: 1 day	Diagrams; Section 11	Drafted in this document. Not a dashboard task.
7. Finalizing Scope, Assumptions and Constraints	Set the limits of the phase.	Not shown. Proposed: 0.5 day	Section 12	Drafted in this document. Not a dashboard task.

Dashboard cards (Figure 1)

Card	Sub-tasks shown	Phase tag	Column
Creating Developer Account	Account Activation	Phase 1: Requirement Analysis & Planning	In Progress
Objects	Creating Student Object	Phase 2: Backend Development & Configurations	In Progress
Fields	Student, Course, Instructor and Enrollment object fields	Phase 2: Backend Development & Configurations	In Progress
Create Relationships	Lookups from Enrollment to Student, Course and Instructor	Phase 2: Backend Development & Configurations	In Progress
Validation Rules	Student Email Domain Validation; Fees Must Be Paid Before Approval	Phase 2: Backend Development & Configurations	In Progress

Note: the dashboard tags the object, field, relationship and validation cards as Phase 2, whereas this Phase 1 document plans them. The team should confirm how these tasks are grouped for submission.

14. Phase 1 Conclusion

Phase 1 has defined what the **Student Enrollment & Course Management System** must do and how it will be organised in Salesforce. The requirements cover student management, course management, enrollment, instructor assignment, approval, payments, validation and reporting. The design uses four objects, Student, Course, Instructor and Enrollment, with Enrollment linking the others.

The object and field tables give the next phase a clear list of what to build. The relationship design shows how the Enrollment lookups will keep the data connected and consistent. The business rules state which conditions the system must enforce: a college email address, fee payment before approval, and instructor assignment by category. The process diagrams show the order of the enrollment, instructor assignment and approval steps that the automation must follow.

The screenshots confirm the Developer Org, the Student, Course and Instructor objects, the Student fields, and the active email validation rule. Every other item in this document is clearly marked as listed, partly confirmed or proposed, and it should be confirmed by the team before it is built. Prepared for the project team led by SAIF ALI, with T MOHAMMED RAZI and S MOHAMMED ZABIULLAH.
